

Water Mission!

Water flows through the world around us as it travels through the water cycle, often going unnoticed. Plants and animals are constantly taking water in and releasing it. Water can smooth rocks and carve canyons. Scientists who study water are called hydrologists.

Steps to complete this mission:

- 1) Find an open space. This can be in a park, the wilderness, out a window or your backyard. You choose!
- 2) Find evidence of water. Fill out the fields below with your findings.

Date:

Time:

Location:

Weather (circle one):

Evidence of water:

What observations support your evidence?

Is the water above or below the ground?

What do you think will happen to the water next?

In the space below, draw the water or location of the evidence you identified.

Your mission, should you choose to accept it, is to go outside! You may be surprised at how much fun a simple focused moment in nature can be. Please share with family and friends!

Post your parks/backyard nature photos and tag them with #NatureSceneInvestigator to win prizes from Inside the Outdoors Foundation.

Photos from Orange County locations posted on Facebook, Twitter, or Instagram are eligible. Winners will be chosen quarterly.
