

Cloud Mission!

Clouds are an important part of our climate! They help regulate our planet's temperature. As you hunt for clouds, see how many different types you can find. Scientists who study clouds are called nephologists.

Steps to complete this mission:

- 1) Find an open space. This can be in a park, the wilderness, out a window or your backyard. You choose!
- 2) Find clouds to observe. Fill out the fields below with your findings.

Date:

Time:

Location:

Weather (circle one):    

What kind of cloud are you observing?

What shape is the cloud?

How much of the sky is covered by clouds?

Using your senses, describe the clouds and if they change over time.

Use the space below to draw the cloud.

Your mission, should you choose to accept it, is to go outside! You may be surprised at how much fun a simple focused moment in nature can be. Please share with family and friends!

Post your parks/backyard nature photos and tag them with #NatureSceneInvestigator to win prizes from Inside the Outdoors Foundation.

Photos from Orange County locations posted on Facebook, Twitter, or Instagram are eligible. Winners will be chosen quarterly.
